After you add triggers, you can see them here. A workflow can be triggered when an email is received in a configured inbox. The email account (Microsoft or Google) is configured under credentials with the account type set to Inbound. When a new email arrives, the workflow is triggered. Content data of an email and its attachment can both be used within the workflow.

Workflow Agents can also run on a time-based schedule.

This supports two scheduling models:

- Interval-based execution (for example every few minutes, hours, or days)
- Recurrence-based scheduling using calendar patterns

This type of trigger is useful for automated background processes that need to run periodically without user interaction.

Webhook

Inputtext
string

A webhook trigger allows external systems to start a workflow through a REST API call. Input parameters can be passed as variables during the invocation, which the workflow can then use throughout its execution. This is typically used for system-to-system integrations or event-driven processing.

Update

Configure global workflow error handling here.

If a workflow encounters a permanent error that is not handled within the flow, an email notification is sent with details such as the trace ID, failed node, error message, and employee information for quick troubleshooting.

Branch / Node-Level Error Handling

Errors can also be handled within specific workflow nodes or branches.

Error: Timesheet Workflow Agent - [{{\$context.\$workflow.\$name}}]

Email Template
Timesheet Workflow Agent Error Notification

A workflow error occurred while processing a submitted timesheet. Please review the details below.

Trace Id: [{{\$context.\$workflow.\$traceId}}]

Failed Node: [{{\$context.\$error.\$errorNode}}]

Error Message: [{{\$context.\$error.\$errorMessage}}]

Employee Details

Person Id: [{{\$context.\$variables.PersonId}}]

Assignment Id: [{{\$context.\$variables.AssignmentId}}]

The workflow attempted to process a timesheet document, extract the required information, and generate the corresponding digital time card. The process encountered an error during execution.

Recommended Action

Please review the workflow trace and verify the uploaded timesheet data before retrying the process.

This notification was generated automatically by the Timesheet Workflow Agent.D
